AixBOMS for Service & Cloud Providers

Addressing the Special Requirements of the Provider Business

For **Service & Cloud Providers**, AixpertSoft offers a dedicated application package which addresses the specific diverse requirements of this customer group.

The package comprises three major AixBOMS Enterprise modules:

- The **AixBOMS Business Service Management** module which focuses on the documentation and management of services of any kind - including cloud-based ones – and their relationship to customers and business data. It includes reporting functionality and integrates contract-specific information.
- The **AixBOMS Connectivity** module allows for the search and documentation of logical network paths across a physical infrastructure, functionality which is particularly useful in a carrier environment.
- The **AixBOMS Networking** module creates and manages networks, subnets and IP address structures and hierarchies. IPv6-specific functionality is taken into account as are requirements for temporary parallel operations of IPv4 and IPv6 environments (dual stack).
